SCIENCES MA	S S S S S S S S S S S S S S S S S S S	Course: Program: Duration: Paper Date: Section:	MS 1 HOUR 45 Min November 1, 20 MS		Course Code: Semester: Total Marks: Weight Page(s):	CS507 Fall 2020 50	
Exam: Midterm I							
Instruction/Notes: Attempt all questions on the question paper.							
Name: Roll Number:							
Questio	on 1 [10] Shor	t Q/As					
a.	[1] Name a	function in LISP	(discussed in clas	ss) that is no longer wide	ely used due to rea	idability issues:	
b. [1] Function in LISP is in notation.							
	a. Post	fix	b. Infix	c. Prefix	d. None of the	above	
C.	<ul> <li>c. [1] A particular CNF grammar defines rules to form a "word" is as follows:</li> <li><word></word></li></ul>						
d.	<ul> <li>I. [1] If the program written in a particular language is less than the cost of failure system may be significant.</li> <li>a. Writable</li> <li>b. Reliable</li> <li>c. General</li> <li>d. Readable</li> </ul>					ailure of the	
e.	[1] Which of the following is not an imperative language? a. LISP b. C++ c. SNOBOL d. All of them are imperative						
f.	[1] In SNOE	In SNOBOL, binary operators must have at least spaces					
ď	[2] In SNO	1 In SNOBOL, spaces can be used as an operator for different numbers. List two of those					

h. [1]

Consider the following grammar:

- $S \rightarrow AB$
- $A \rightarrow 0 \mid B1B$
- $B \rightarrow bbA$

Which of the following statements is **FALSE**?

- a. The length of every string produced by this grammar is even.
- b. Every string produced by this grammar has at least as many 1's as 0's.
- c. No string produced by this grammar has three consecutive 0's.
- d. No string produced by this grammar has four consecutive 1's.
- i. [1] Consider the following grammar:

$$S \rightarrow (S) \mid 0$$

Which of the following statements is (are) **TRUE**?

- I. The grammar is ambiguous.
- II. The grammar is suitable for top-down parsing.
- III. The grammar is suitable for bottom-up parsing.
  - a. II only
- b. I and II only
- c. II and III only
- d. All of them

# Question 2 [10]

```
Let = \{\text{void, int, double, name, (, ), ,, ;}\}
```

Define a CFG for C++ function prototype For example:

- void name (int name, double name);
- int name ();
- int name (int, double name, int);
- void name(int, int);

Note that there can be more than three parameters sent in the function prototype.

#### Question 3[20 = 5 + 5 + 10]

### Part a) and b) has no partial credit.

a. Consider the following function: (defun mystery (list))

(cond

((null list NIL) ((null (rest list) (list (first list))) (t (cons (first list)

(mystery (rest (rest list)))))))

Assuming that the list L is (4 3 2 1), what will be the result returned by the following: **(mystery L)** 

Show your work to get credit.

b. Assuming that the following definitions are executed in this order:

(define x '(3 28 400))

(define y (cons (cdr x) '(6 15 77)))

What is the result of typing the following into the LISP compiler?

- i) y => ???
- ii)  $(\cos 'x (cdr (cdr x))) => ???$

c. Define a Scheme function, odds, that takes a list and returns every other one, starting with the first. See the example to the right below.

```
> (odds '() )
()
> (odds '(a))
(a)
> (odds '(a b))
(a)
> (odds '(a b c))
(a c)
> (odds '(a b c d e f g h))
(a c e g)
```

#### Question 4[10 = 5 + 3 + 2]

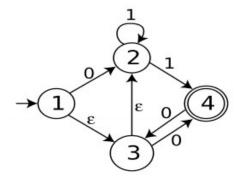

## Part a) does not have partial credit.

a.

i) Explain the following SNOBOL code with respect to replacement through Pattern Matching. Explain what is happening in each line

- ii) What will be the final result?
- b. A class of assignment statements in C/C++ has the following form: a **op**= b where **op** is an arithmetic or logic operator. Discuss the pros and cons of these statements from the perspective of readability and writability.

c. Determine whether the following strings are accepted or not be the NFA given below. Show complete path to get credit for both acceptance and rejection:

- a) 10001
- b) 0111101
